- **Collections:** Organize API requests into collections for better management and sharing. Collections can be shared with team members.
- **Environments:** Define environments to manage different configurations (e.g., development, staging, production) and switch between them easily.
- **Automated Testing:** Write test scripts in JavaScript to automate testing and validation of API responses.
- **Mock Servers:** Create mock servers to simulate API responses for testing purposes, allowing teams to work on different parts of the project.
- **Monitoring:** Set up monitors to run API requests at scheduled intervals and track performance and uptime.

What is Fiddler?

Fiddler is a web debugging proxy tool that captures and inspects HTTP/HTTPS traffic between your computer and the internet.
