Refresh Token in Web API

Generally, we use Authentication Token in Web API to authenticate the client request. But, what happens when the token expires? Do we need to ask the user to provide his/her credentials again? Well, we can avoid this by using Refresh Token. In this article, we will see how we can use Refresh Token in Web API.

Refresh Token in Web API

Refresh Token is a special token that can be used to obtain additional access tokens.

Refresh Token is a special token that can be used to obtain additional access tokens. Refresh Token is a long lived token. Refresh Token is used to get a new access token when the current access token has expired. In order to do so, the client needs to send a request to the Token Server (Authorization Server).

Refresh Token is a long lived token. Refresh Token is used to get a new access token when the current access token has expired.

Why we use Refresh Token in Web API?

Generally, we use Authentication Token in Web API to authenticate the client request. But, what happens when the token expires? Do we need to ask the user to provide his/her credentials again? Well, we can avoid this by using Refresh Token. In this article, we will see how we can use Refresh Token in Web API.

What is the Refresh Token in Web API?

Refresh Token is a special token that can be used to obtain additional access tokens.

Refresh Token is a long lived token. Refresh Token is used to get a new access token when the current access token has expired.

What is the Refresh Token Grant Type?

Refresh Token Grant Type is used to request a new access token using the refresh token issued to the client.

Why we need Refresh Token Grant Type?

Refresh Token Grant Type is used to request a new access token using the refresh token issued to the client.

How Refresh Token Grant Type works?

Refresh Token Grant Type works as follows:

- The client sends a request to the Token Server (Authorization Server) for an access token.
- The Token Server issues an access token and a refresh token.
- The client uses the access token to access the protected resources.
- When the access token expires, the client sends a request to the Token Server (Authorization Server) for a new access token using the refresh token.
- The Token Server issues a new access token.

Implementing the Refresh Token Authentication Scheme

In this section, we will see how to implement the refresh token authentication scheme in Web API.
